

Phase 1: Automated Market Research & Data Processing

This phase replaces the manual spreadsheet work. The software will take raw competitor data and filter it down to only the most valuable search terms.

1. Data Collection & Cleaning

- **The Input:** The system will prompt the user to upload the raw data file (the CSV export from the competitor research tool) containing the top 10 competitors who have similar designs and prices.
- **The Clean-Up:** The software automatically deletes all irrelevant information from the file. It will only keep two pieces of data:
 1. **Search Volume:** How many people search for this term.
 2. **Organic Rank:** Where the competitors naturally show up in the search results.

2. The Relevance Scoring Engine

The software will automatically create a new "Relevance Score" column and apply your specific grading rule.

- **The Rule:** The system looks at the top 10 competitors for a specific search term. It counts how many of those competitors rank in the top 14 spots (rank < 15).
- **The Score:** It assigns a score from 0 to 10. A score of 10 means all competitors rank highly for that term (highly relevant). A score of 0 means none do (irrelevant).
- **The Filter:** The software automatically deletes any search term that scores a 0, 1, or 2.

3. Automated Verification (The "Manual" Check)

To narrow the list down further, the software will perform an automated cross-check on Amazon to simulate human research.

- **The Action:** The system automatically searches Amazon for the remaining terms.
- **The Validation:** It looks at the top 10 to 15 search results. If 3 to 5 of your original chosen competitors are present in those top results, the search term is marked as **"Approved."** If not, it is discarded.

Phase 2: Automated Campaign Creation

Once the software has the final list of "Approved" search terms (usually the top 20 to 50), it will automatically build the advertising campaigns.

1. The Naming Convention System

The software will automatically name every campaign using a standardized template so everything remains perfectly organized.

Format Component	Description	Example
Product Name	What you are selling	CoffeeMaker
Ad Type	Sponsored Product/Brand/Display	SP
Targeting	Auto/Manual/Video	Manual
Match Type	Exact/Phrase/Broad	Exact
Keyword/Group	The specific word or group number	Coffee Beans or Relevant1
Date	When it was created	May11

2. Building the "Hero" Campaign

The software isolates the absolute most important search term and creates a dedicated, aggressive campaign just for it.

- **Structure:** 1 Campaign > 1 Ad Group > 1 Keyword.
- **Budget:** Set automatically to \$10.
- **Bidding:** The software sets the bid at \$1.00 (or pulls Amazon's suggested estimated bid).

3. Building the Grouped Campaigns (Top 20-50 Terms)

The software divides the remaining approved terms into small batches of 5 to 7 words. It then creates three distinct types of campaigns for each batch.

- **Exact Match Campaigns:**
 - *Rule:* The ad only shows if the customer types these exact words.
 - *Budget:* \$10 per campaign.
- **Phrase Match Campaigns:**
 - *Rule:* The ad shows if the customer types the phrase, even with other words before or after it.
 - *Budget:* \$10 per campaign.

- **CRITICAL AUTOMATION:** The software will automatically take the words from the *Exact Match* campaign and block them here (Negative Exact). This ensures the Phrase campaigns don't steal traffic from the Exact campaigns.
 - **Broad Match Campaigns:**
 - *Rule:* The ad shows if the customer types words related to your terms, in any order.
 - *Budget:* \$10 per campaign.
 - **CRITICAL AUTOMATION:** The software will automatically take the words from the *Phrase Match* campaign and block them here (Negative Phrase). This forces the Broad campaign to only hunt for completely new, undiscovered search terms.
-

Phase 3: The 14-Day Automated Monitoring System

The software will now watch the campaigns and make mathematical adjustments without emotional bias.

1. The First 7 Days (Budget Consumption Check)

- The software monitors the \$10 daily budget for every campaign.
- **The Adjustment:** If a campaign is not spending its full \$10, it means the bid isn't high enough to win ad space. The software will automatically increase the bid for those specific search terms by **10%**. It will repeat this daily until the budget is being consumed.

2. Day 7 Evaluation (The Profitability Check)

- After exactly 7 days, the software calculates the ACOS (Advertising Cost of Sales—how much was spent on ads compared to the sales generated).
- **The Decision:** If the ACOS is less than 50%, the software locks the campaign and makes zero changes. It allows the campaign to run untouched for another 7 days (Days 8 through 14) to gather reliable, long-term shopping data before attempting any complex optimization.
